

Habitats

A habitat is the place where an animal lives. The habitat contains everything that the animal needs to survive. All animals have three basic needs that they must have to be able to live:

- air
- water
- food

Animals may have other specific needs, such as the need for shelter, the correct temperature or a place to keep them safe from predators. Different animals are suited to different habitats. Where they live may depend on what they need to eat and what type of animal they are. For example, fish need to be in water to stay alive.

My Habitat Drawing

Choose an animal. Draw and label its habitat. Make sure your habitat has everything that meets the basic needs of the animal that lives there.

What is a habitat?
What habitat does your chosen animal live in?
How does your habitat meet the basic needs of the animal living there?
Could your animal live in a different habitat?
Do any other animals live in your habitat?
